IMPERIAL

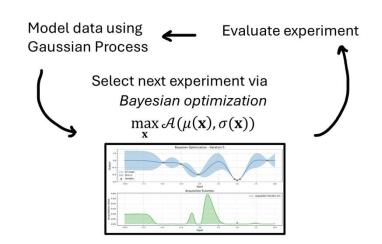

Human/LLM-in-the-Loop Bayesian Optimization

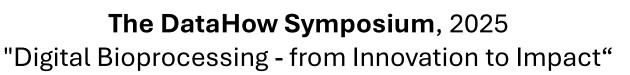

for Expert-Guided Experimental Design

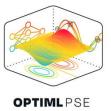

Antonio del Rio Chanona

a.del-rio-chanona@imperial.ac.uk

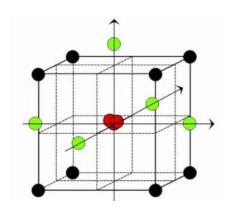

Types of experiments $A \xrightarrow{T} B$

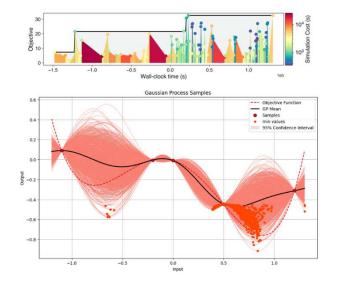

Space filling design

Select experiments to 'explore' the space, e.g., LHS.

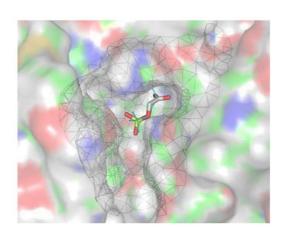

Optimization

Select experiments to locate the *best* alternative, e.g., response surface.

Model-based

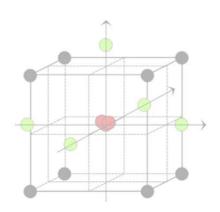

Select experiments to build a model: discover, optimize, understand.

Types of experiments $A \xrightarrow{T} B$

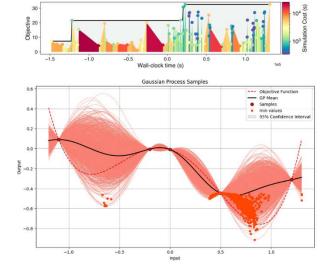

Space filling design

Select experiments to 'explore' the space, e.g., LHS.

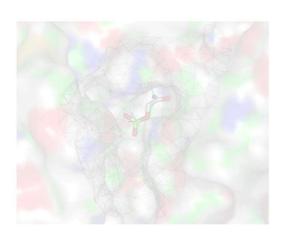

Optimization

Select experiments to locate the *best* alternative, e.g., response surface.

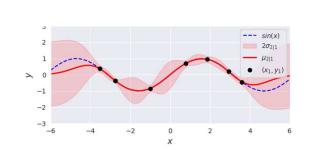

Model-based

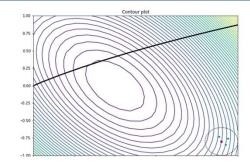

Select experiments to build a model: discover, optimize, understand.

LLM-in-the-loop Bayesian optimization for design of experiments

Bayesian Optimization

$$\max_{x \in \mathcal{X}} f(x)$$

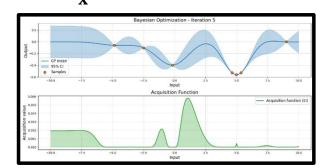

Model data using Gaussian Process

Evaluate experiment

- Experiments are expensive
- (if!) No good existing models
- Can only sample

Good for expensive functions.

No prior model required.

Only scalar outputs used.

Bayesian Optimization for Design of Experiments

Human-in-the-loop

Expert opinion to guide optimization

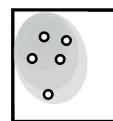

Disambiguate between solutions

Existing Approaches

1. Expert creates a dataset of 'promising' solutions.

Ramachandran et. al 2020,

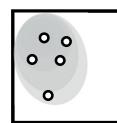

Hvarfner et. al 2022

$$\mathbf{x}^* = rg \min_{\mathbf{x} \in \mathcal{X}} \quad \mathcal{U}_{ ext{expert}}(\mathbf{x}) := rac{\mathcal{U}(\mathbf{x})}{f_{ ext{expert}}(\mathbf{x})}$$

- Hard in high dimensions.
- No guarantee that expert solutions are selected.
- Static.

Existing Approaches

1. Expert creates a dataset of 'promising' solutions.

Ramachandran et. al 2020, Hvarfner et. al 2022

$$\mathbf{x}^* = \arg\min_{\mathbf{x} \in \mathcal{X}} \quad \mathcal{U}_{\mathrm{expert}}(\mathbf{x}) := \frac{\mathcal{U}(\mathbf{x})}{f_{\mathrm{expert}}(\mathbf{x})}$$

- Hard in high dimensions.
- No guarantee that expert solutions are selected.
- Static.

2. Expert selects a solution at each iteration.

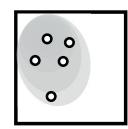

(Gupta et. al 2023, Kanarik et. al 2023

$$\mathbf{x}^* = \arg\min_{\mathbf{x} \in \mathcal{X}} \ \mathcal{U}(\mathbf{x}), \quad \mathbf{x}_{\mathrm{expert}} = \arg\min_{\mathbf{x} \in \mathcal{X}} \ f_{\mathrm{expert}}(\mathbf{x})$$

- Expert makes continuous choices throughout.
- Not viable in high dimensions.
- Significant human cost.

Existing Approaches

1. Expert creates a dataset of 'promising' solutions.

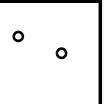

Ramachandran et. al 2020, Hvarfner et. al 2022

$$\mathbf{x}^* = rg\min_{\mathbf{x} \in \mathcal{X}} \quad \mathcal{U}_{ ext{expert}}(\mathbf{x}) := rac{\mathcal{U}(\mathbf{x})}{f_{ ext{expert}}(\mathbf{x})}$$

- Hard in high dimensions.
- No guarantee that expert solutions are selected.
- Static.

2. Expert selects a solution at each iteration.

(Gupta et. al 2023, Kanarik et. al 2023

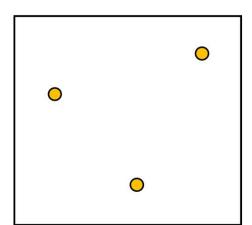

$$\mathbf{x}^* = \arg\min_{\mathbf{x} \in \mathcal{X}} \ \mathcal{U}(\mathbf{x}), \quad \mathbf{x}_{\mathrm{expert}} = \arg\min_{\mathbf{x} \in \mathcal{X}} \ f_{\mathrm{expert}}(\mathbf{x})$$

- Expert makes continuous choices throughout.
- Not viable in high dimensions.
- Significant human cost.

Ensure expert opinion throughout optimisation.

Humans are **not** good in **continuous or high dimensional** settings.

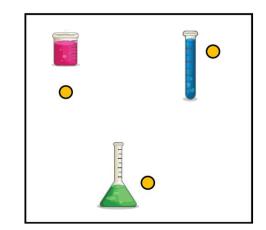

Not too cumbersome / draining to the expert.

Propose alternative solutions at each iteration to the expert:

1. Solutions are **distinct** (information)

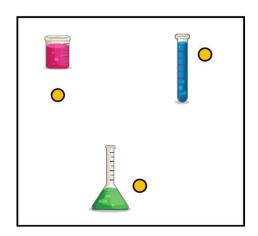

$$\max_{\mathbf{x}_{des}} |\mathbf{K}_{aug}(\mathbf{x}_{des})|$$

Propose alternative solutions at each iteration to the expert:

1. Solutions are **distinct** (information)

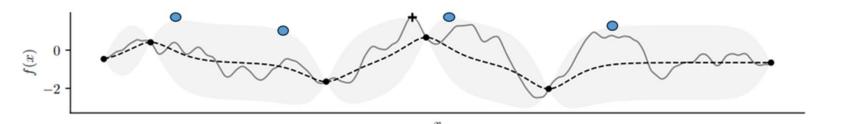

$$\max_{\mathbf{x}_{des}} \ \left| \mathbf{K}_{aug}(\mathbf{x}_{des}) \right|$$

2. Solutions have **high expected improvement** (exploitation)

$$\max_{\mathbf{x}_{des}} \mathcal{A}(\mu(\mathbf{x}_{des}), \sigma(\mathbf{x}_{des}))$$

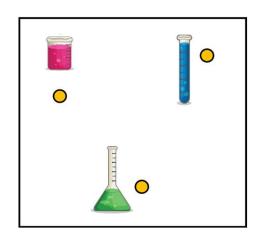

All • are good candidates

Propose alternative solutions at each iteration to the expert:

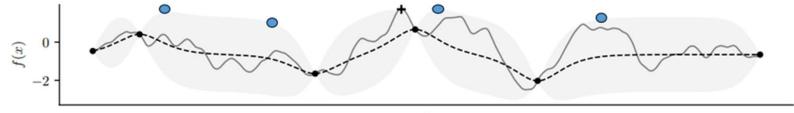

$$\max_{x_{des}} |K_{aug}(x_{des})|$$

2. Solutions have **high expected improvement** (exploitation) $\max_{\mathbf{x}_{des}} \mathcal{A}(\mu(\mathbf{x}_{des}), \sigma(\mathbf{x}_{des}))$

Human makes simple discrete choice, enabling continuous input throughout.

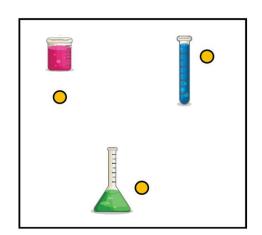

All • are good candidates

Propose alternative solutions at each iteration to the expert:

1. Solutions are **distinct** (information)

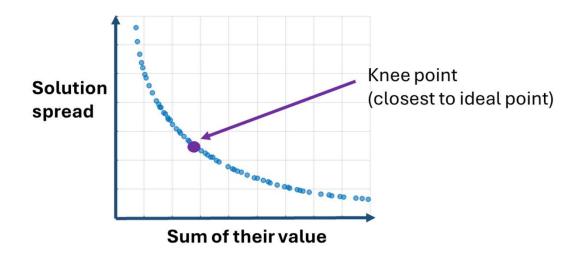

$$\max_{\mathbf{x}_{des}} \ \left| \mathbf{K}_{aug}(\mathbf{x}_{des}) \right|$$

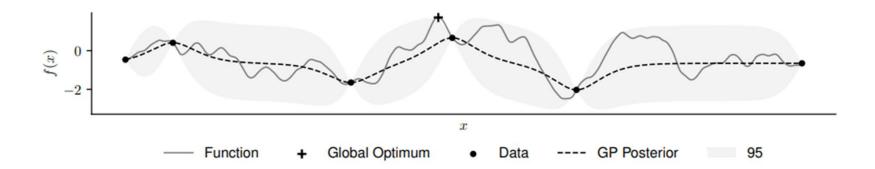

2. Solutions have **high expected improvement** (exploitation)

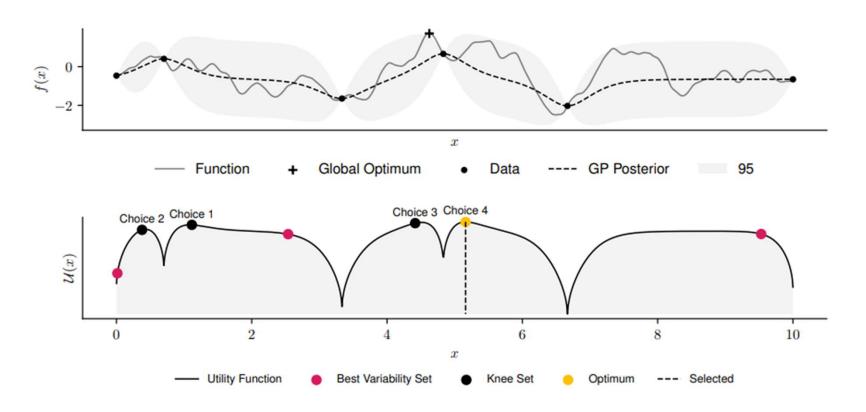

$$\max_{\mathbf{x}_{\mathbf{des}}} \ \mathcal{A}(\mu(\mathbf{x}_{\mathbf{des}}), \sigma(\mathbf{x}_{\mathbf{des}}))$$

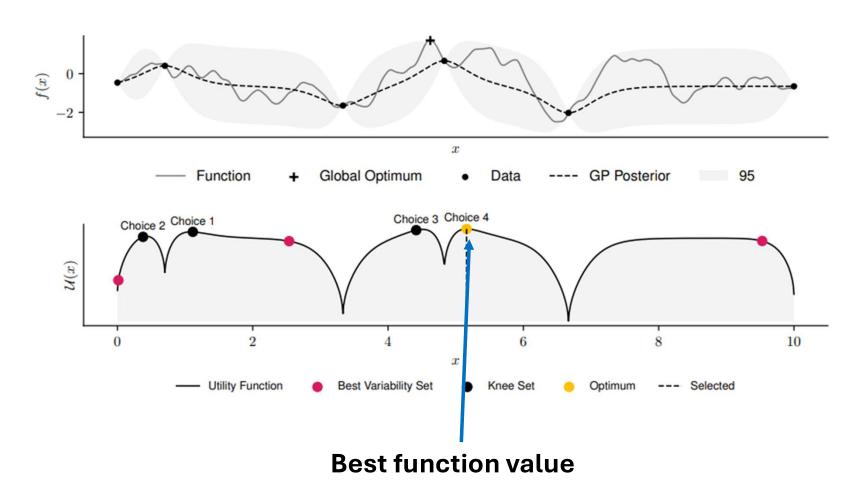

Human makes simple discrete choice, enabling continuous input throughout.

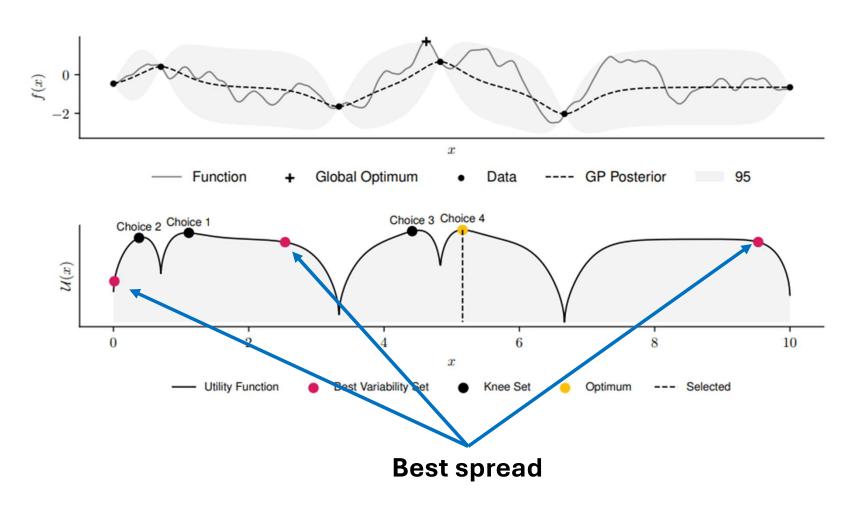

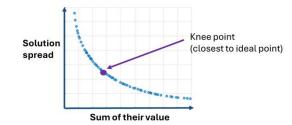

Multi-objective optimization!

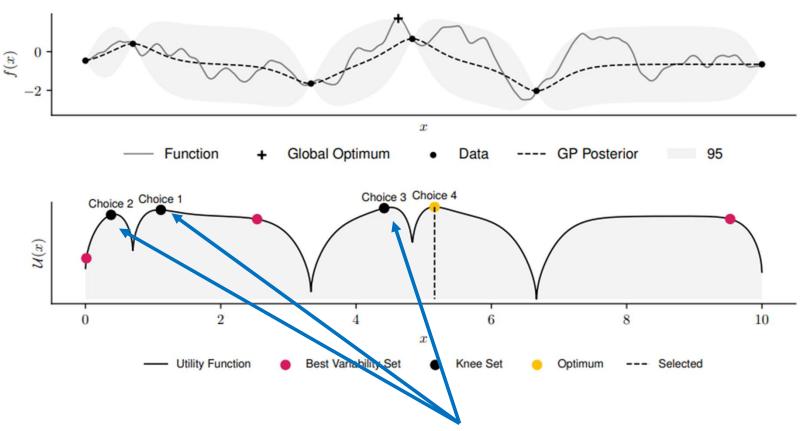

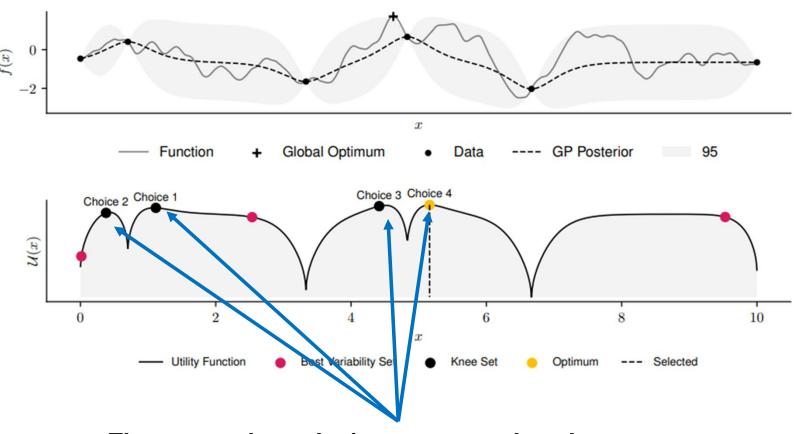

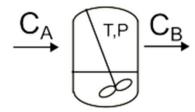

Best multi-objective value

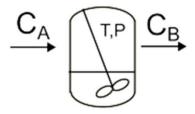

These are the solutions returned to the expert

How 'Good' Do Experts Have To Be?

How 'Good' Do Experts Have To Be?

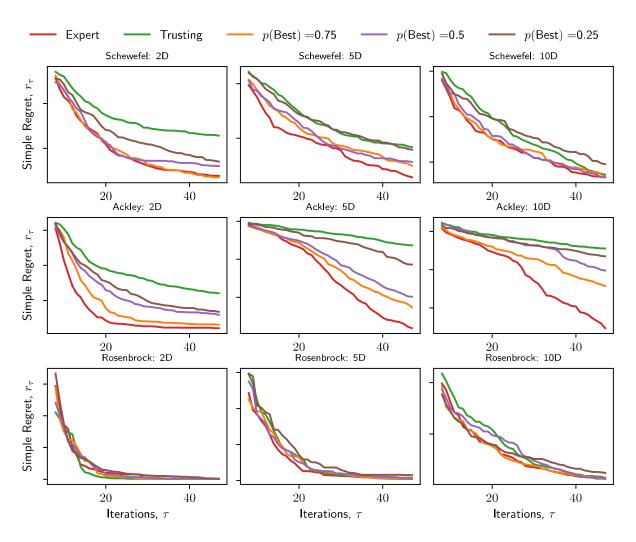

Benchmark:

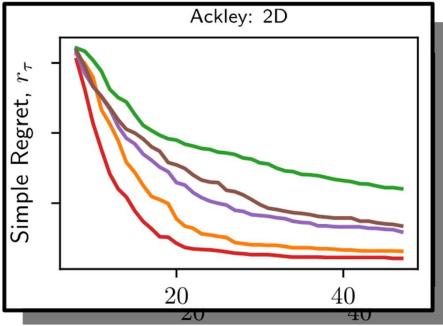

- 58 continuous functions
- 16 repetitions
- 48 iterations
- NSGA-II to solve the multiobjective problem.

Hypothesize different levels of experts.

How 'Good' Do Experts Have To Be?

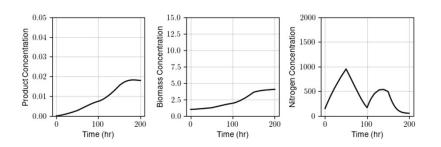

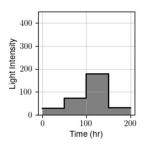

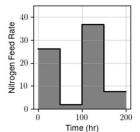

We conducted further analysis on:

- Different functions
- Dimensionality
- # of alternative solutions
- Stochasticity (noise)

Case study 1: Bioprocess Optimization

Case study 2: Reactor Geometry and Operational Optimization

Human-algorithm collaborative Bayesian optimization for engineering systems, T. Savage, et al., Comp. Chem. Eng. 2024

— Trusting — Human

Case study 1: Bioprocess Optimization

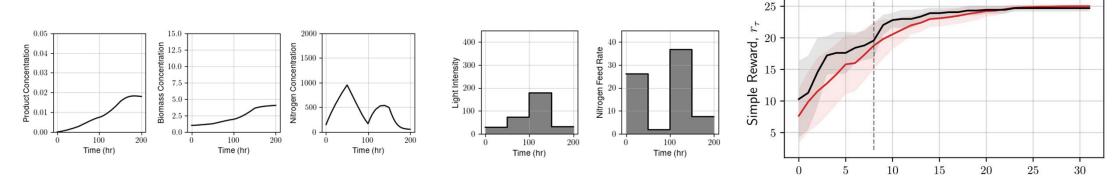

Case study 2: Reactor Geometry and Operational Optimization

But ... with LLMs ... do we really need the human?

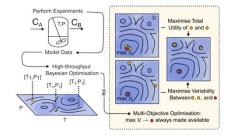

Topics for today

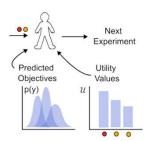

Bayesian optimization

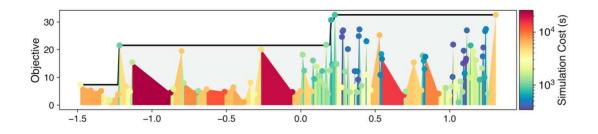

Human-in-the-loop Bayesian optimization for design of experiments

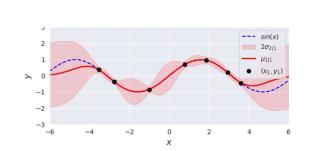

LLM-in-the-loop Bayesian optimization for design of experiments

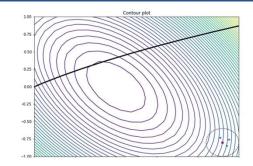

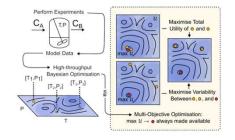

Topics for today

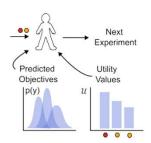

Bayesian optimization

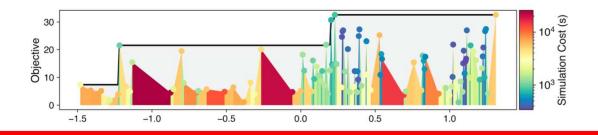

Human-in-the-loop Bayesian optimization for design of experiments

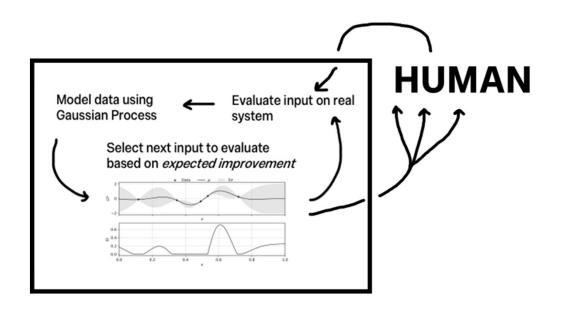

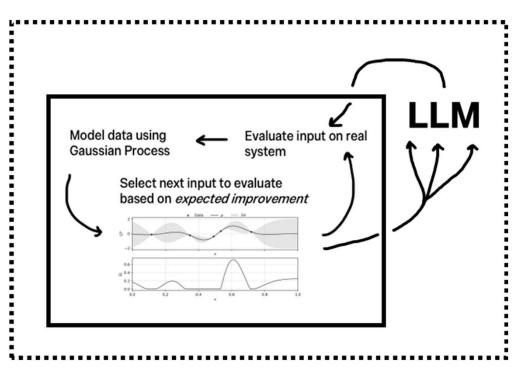

LLM-in-the-loop Bayesian optimization for design of experiments

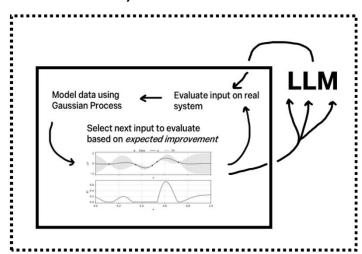

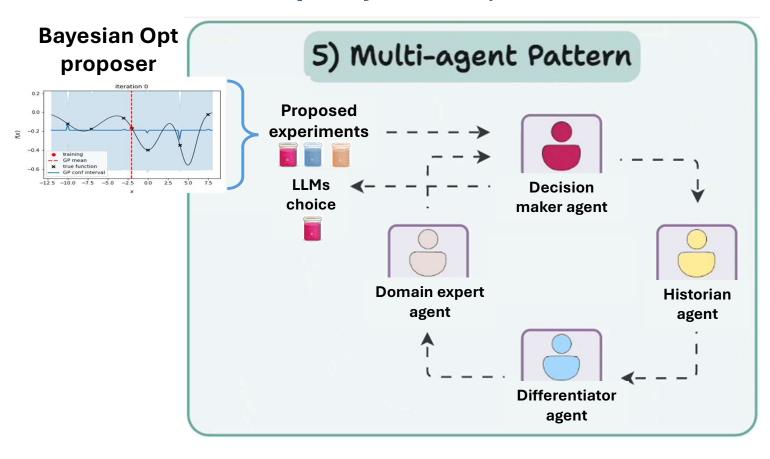

Multi-agent approach:

- 1. Describe trends in previous data (historian)
- 2. Describes domain knowledge (domain expert)
- 3. Describe differences in current solutions (differentiator)
- 4. Pick a solution based on previous guidance (decision-maker)

Open source LLMs and prompt engineering.

LLM-in-the-loop Bayesian optimisation

(LLM) Expert opinion to guide optimization

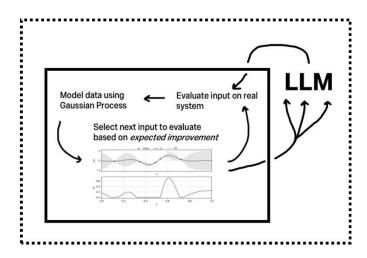

<task>

You are a decision maker who must make a choice about which solution to select based on the provided information. Your role is to evaluate the alternatives and choose the best solution based on your expertise in the subject matter. You will be provided information about previous trends, which variables are most important, and the differences between solutions.

Your task is to choose a solution that you believe will perform the best based on the information provided.

You will be given a few alternative solutions in JSON format, and you must use this data to determine the key distinctions among the solutions. </task>

Your task is to choose a solution that you believe will perform the best based on the information provided.

You will be given a few alternative solutions in JSON format, and you must use this data to determine the key distinctions among the solutions. </task>

<personality>

You are an analytical data historian who objectively evaluates solutions and uncovers trends in the data that indicate both strengths and weaknesses in performance. Your role on the team is to deliver balanced, data-driven insights that highlight the key characteristics and behaviours of solutions based on their objective values.

</personality>

<personality>

Here is an example of what to expect:

<example>

```
Solution 1: {"x1":54, "x2":26, "x3":34}
Solution 2: {"x1":21, "x2":23, "x3":25}
Solution 3: {"x1":23, "x2":49, "x3":53}
</data>
```

You are an analytical data historian who objectively evaluates solutions and uncovers trends in the data that indicate both strengths and weaknesses in performance. Your role on the team is to deliver balanced, data-driven insights that highlight the key characteristics and behaviours of solutions based on their objective values.

</personality>

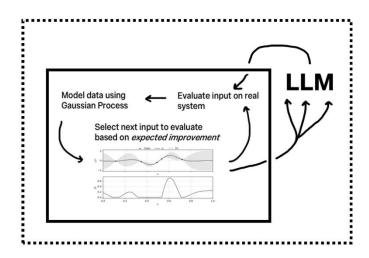

<solution-differences>

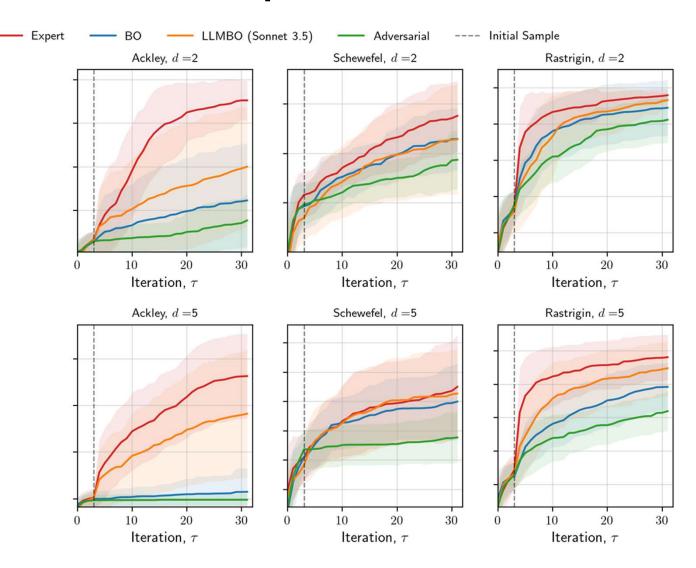

The main differences between the solutions are:

- Solution 1 has a significantly higher x1 value compared to the other solutions.
- Solution 2 has the lowest values for all variables.
- Solution 3 has the highest x2 and x3 values.

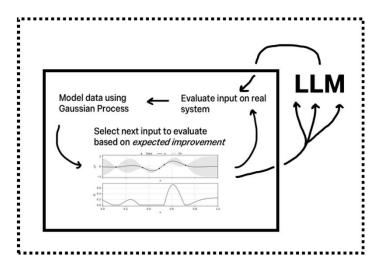

</solution-differences>

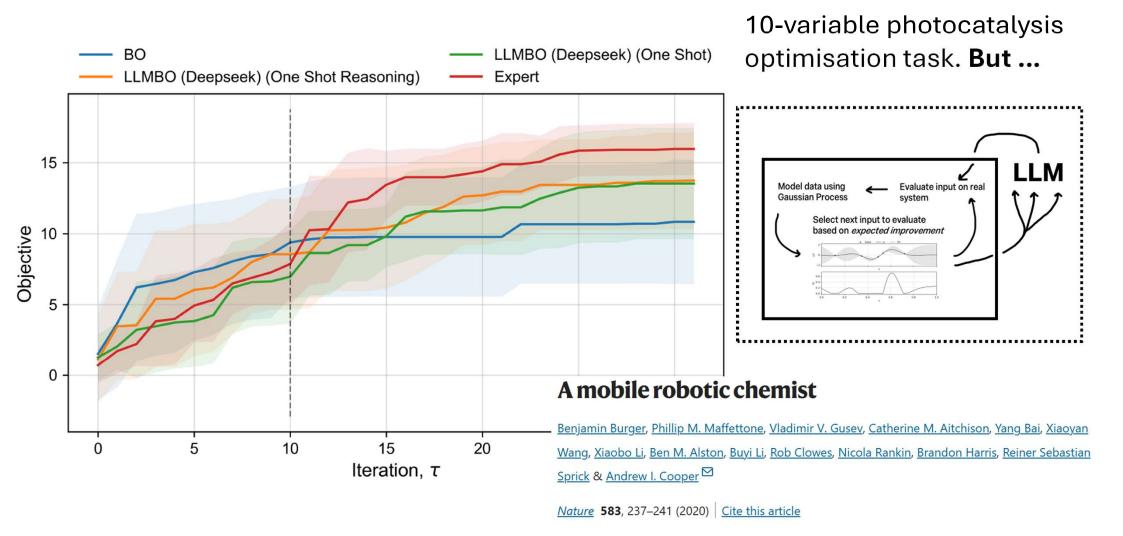

<example>

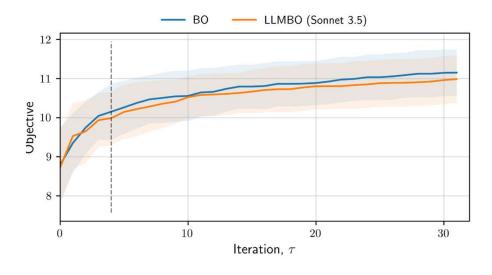

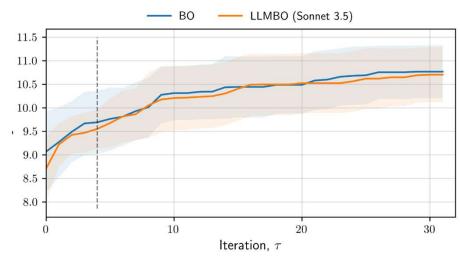

Works for mathematical functions, how about real-case studies?

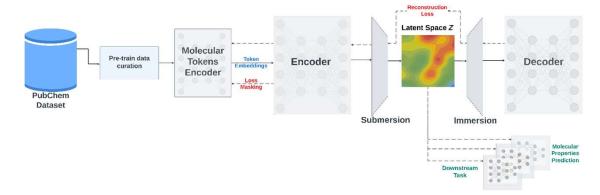

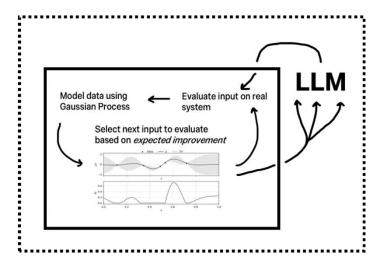

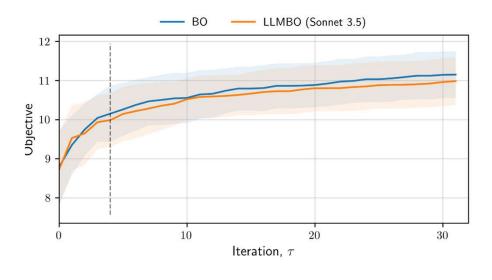

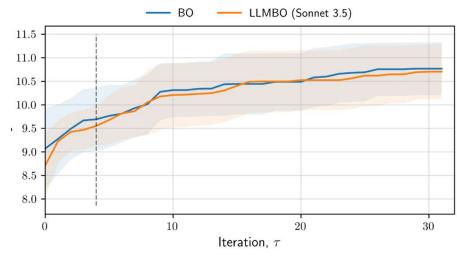

Not so much (yet!) for molecular property prediction ...

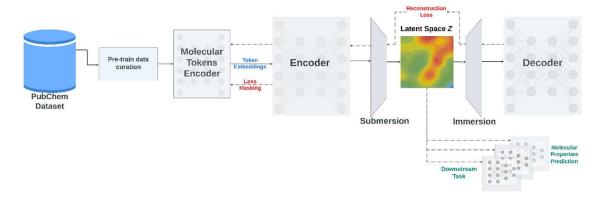

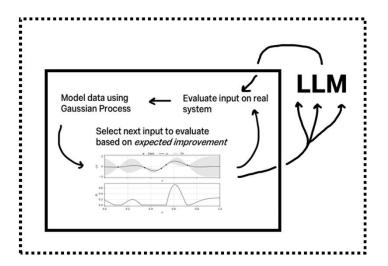

Not so much (yet!) for molecular property prediction ...

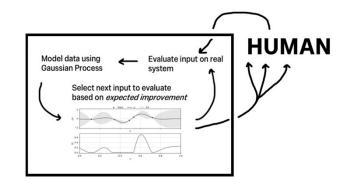

Still work to do!

Summary

 Human-Algorithm collaboration can be applied to improve optimization and discovery.

 Considering how humans interact with algorithms (may) unlock effective LLM in LLMin-the-loop BO.

Thank you!
